

CASE SUMMARY

Identified a patent from the portfolio for which infringement can be shown through practical testing

Value Delivered

Client was provided with a detailed infringement mapping. A significant amount of infringement evidences were collected through testing the product.

Problem to be solved

For his software patent, the client wanted to identify infringing product. The patent had very technical and lengthy claims which made it difficult to show a complete overlap. The insufficient available product information was also a major obstruction for a cent percent overlap.

Solutions offered

To show the infringement, GreyB conducted testing of the target product (i.e. AI-based messaging app) in different phases as mentioned below:

(i) Different scenarios were created to check the working of the app in different situations.

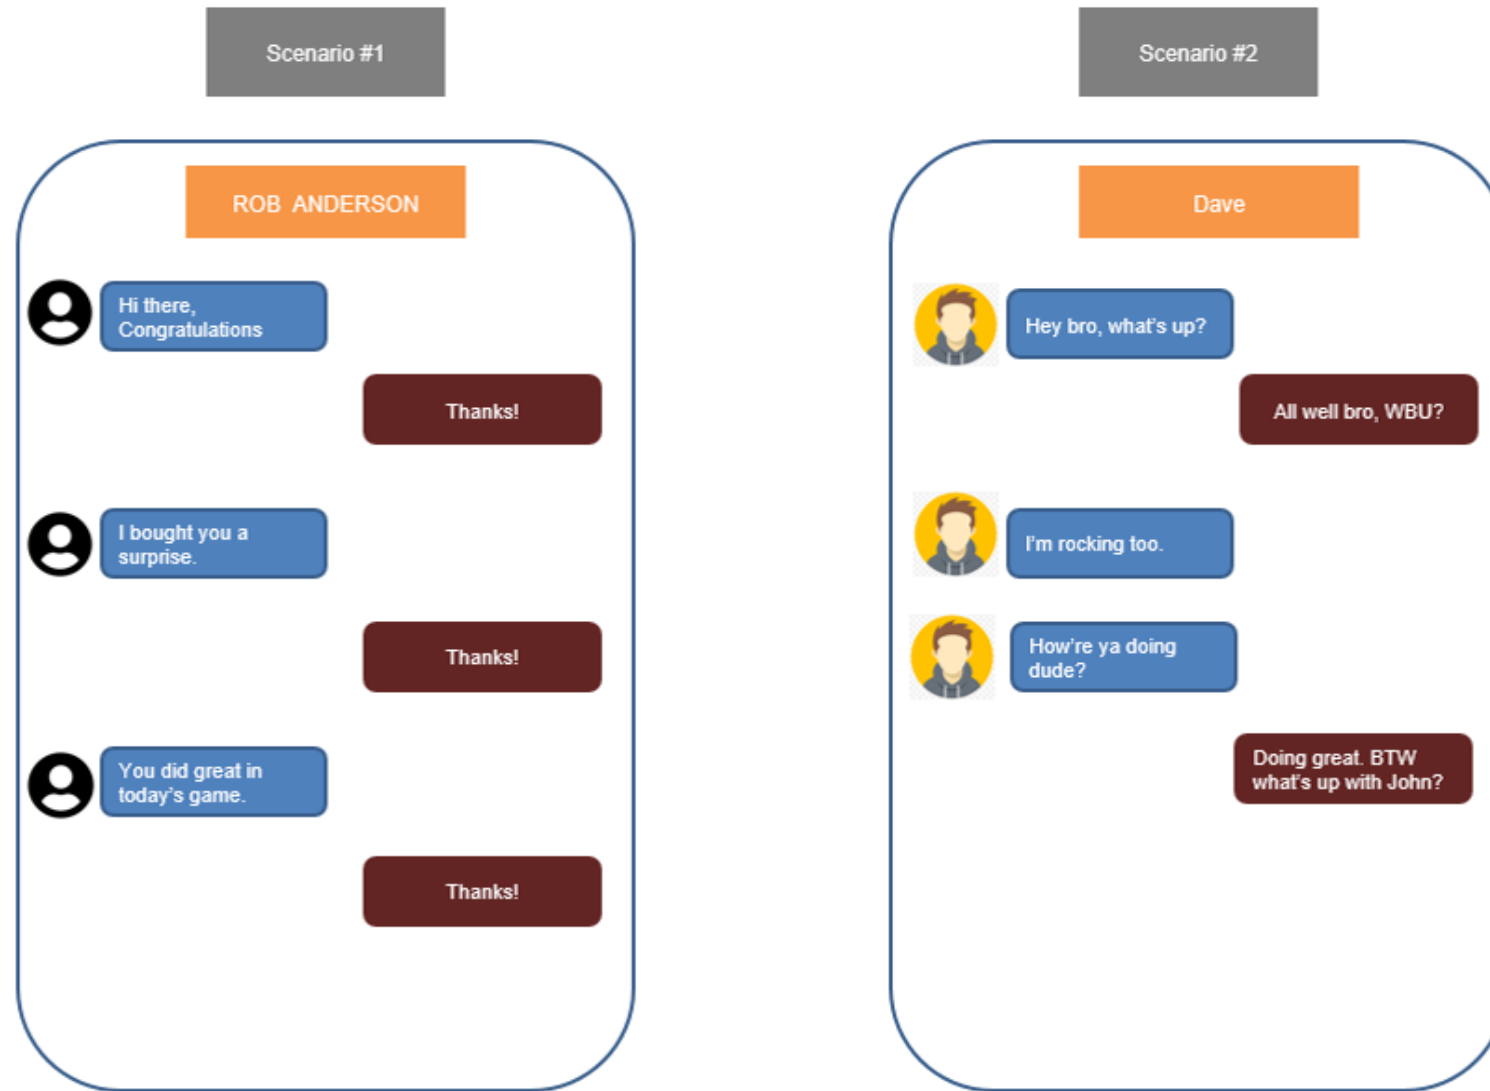

(ii) For each scenario the product was firstly trained with the training data and then tested with test data.

(iii) The outputs of the test scenarios were included in the mapping report with detailed comments explaining how they were mapped against the claim elements.

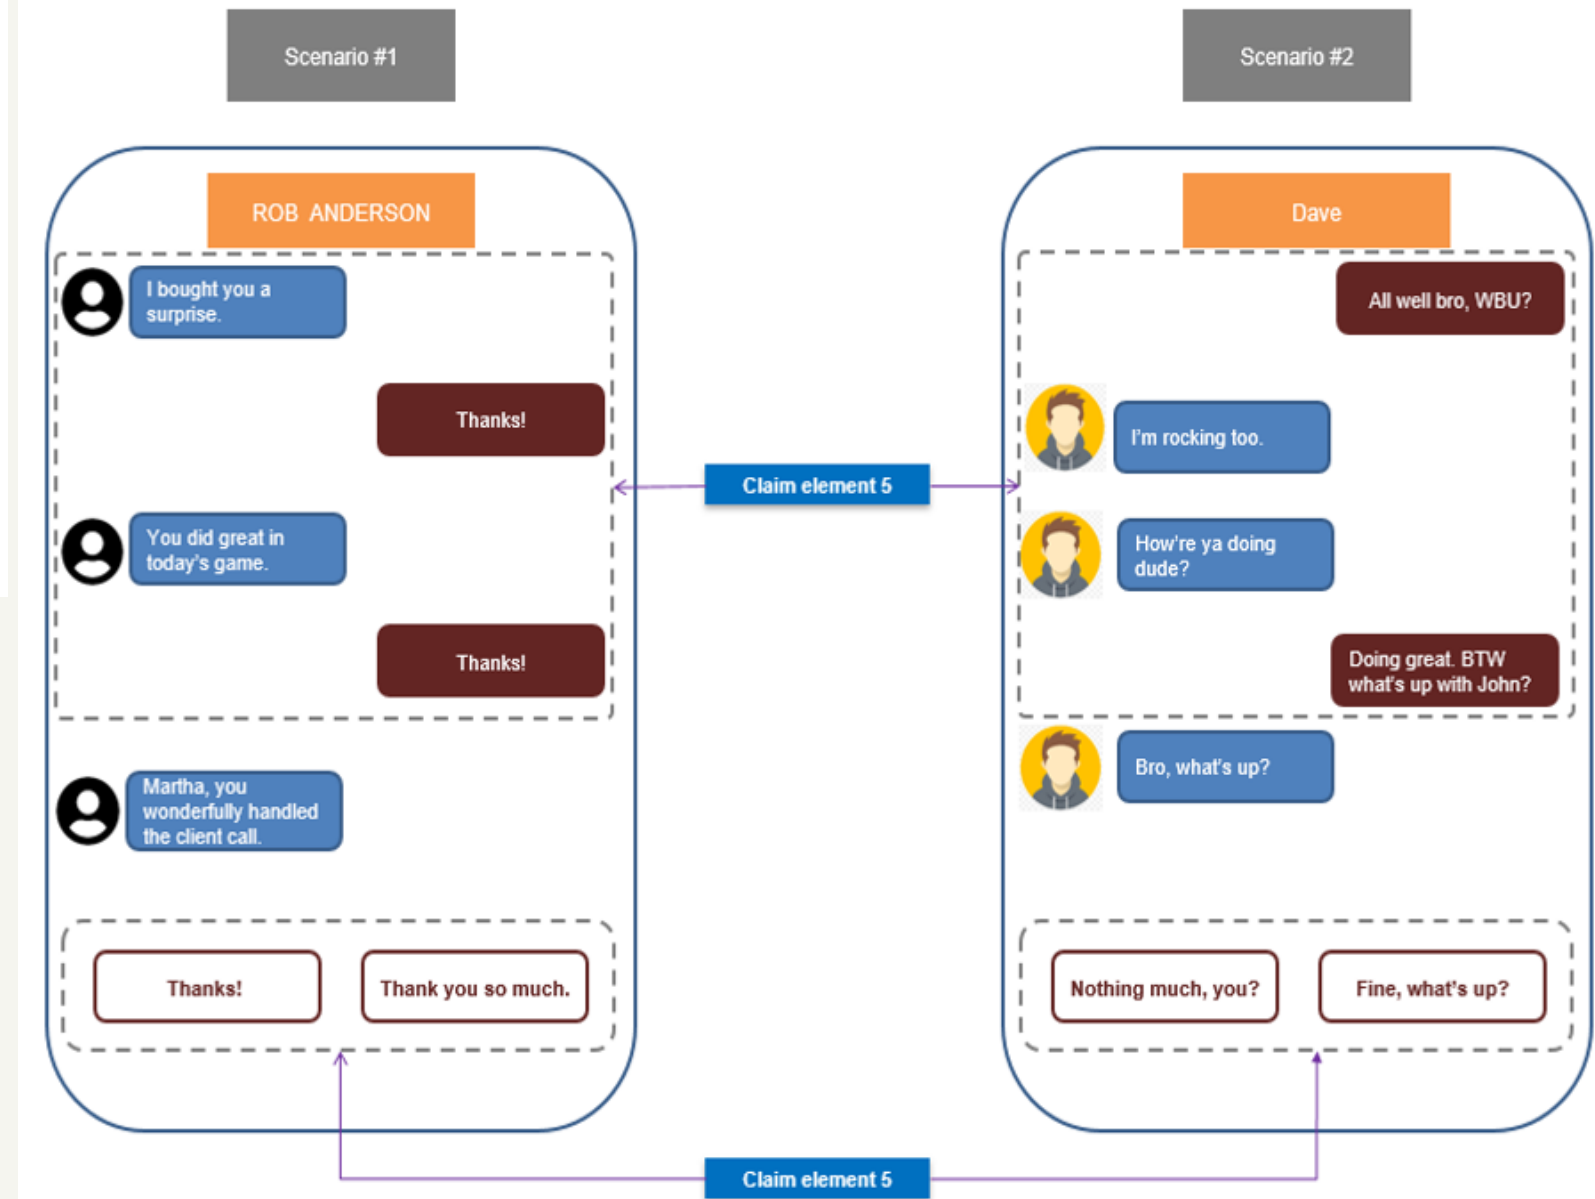

The client was provided with a very detailed and comprehensible mapping that covered evidence for the totality of claim elements.

Training the different scenarios with training data
